

How Extended Validation SSL can help to increase online transactions and improve customer confidence

Phishing scams and online fraud have created an environment of fear and doubt among online shoppers. New phishing sites are emerging at an alarming rate (the number of unique phishing Web sites detected by the APWG rose to 25,328 in December 2007, an increase of more than 7% since the month of November).¹ Phishing is a problem that affects all of us. Even if you are not a target, phishing casts its net far and wide and it has a detrimental effect on consumer confidence:

- 78% of the UK population worry about identity theft²
- 43% have experienced identity fraud or know someone who has²
- 84% believe businesses are not doing enough to protect them²

To regain consumer trust, site owners need an easy, reliable way to show customers that their transactions are secure and that the Web site is legitimate. To help face up to such threats, security vendors and Internet browsers have combined forces, under the CA/Browser Forum, to establish the Extended Validation Standard for SSL Certificates.

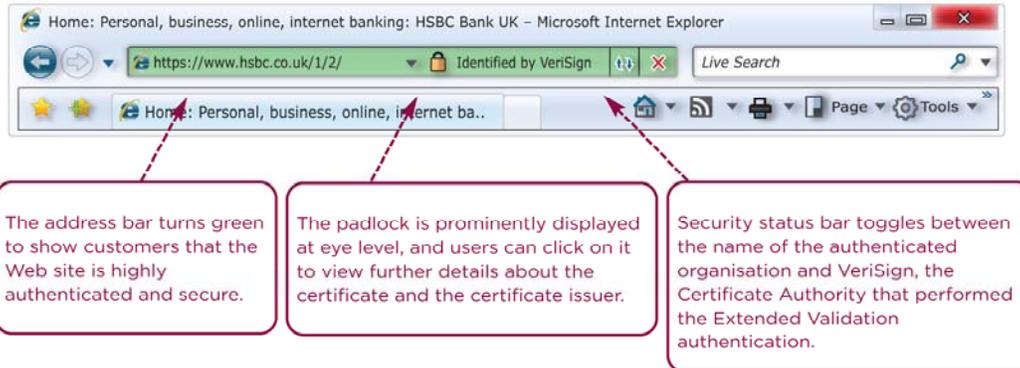

The Solution

Safely navigating the Internet has become increasingly difficult, and the leading browsers have responded to this with increased security measures. The latest browsers, including Microsoft® Internet Explorer 7 (IE7), Firefox 3.0, and Opera 9.5 can now detect the presence of Extended Validation (EV) SSL Certificates and display unique interfaces to identify the presence of such certificates. The introduction of new color schemes and security status bars in these new browsers, when detecting an Extended Validation SSL Certificate, now help users make better and safer decisions when transacting online (shopping, banking, etc.).

The Green Address Bar of Extended Validation SSL

Now when shoppers visit a Web site secured with an Extended Validation SSL Certificate, the latest browsers trigger the address bar to turn green and display the name of the organization listed in the certificate, as well as the certificate's security vendor in some cases.

A secure connection has been established between browser and Web site, and the Web site has been authenticated according to rigorous industry standards. In the example below, the browser controls the display, pulling information from the SSL Certificate and displaying it in the address and security status bar, and making it extremely difficult for phishers and counterfeiters to hijack your brand and your customers.

Microsoft® Internet Explorer 7, Firefox 3.03,³ Opera 9.5, and future versions of these browsers will all support Extended Validation SSL and trigger the green bar. As of July 2008, these browsers accounted for over 70% of the systems in use in the UK, with Internet Explorer 7 covering 53.85% of the market.⁴

Alternatives to the Green Bar in Internet Explorer 7

The White Address Bar

When you are about to enter sensitive information (e.g., personally identifiable information, usernames and passwords, bank accounts, etc.) you should always look for the secure session indicator, “https://” and the Security Status Bar and proceed according to the colour coding of the Address Bar (white, green, and red).

If a secure session starts and the bar remains white, then the page is encrypted with SSL but no identity information is available.

In this case, you should carefully read the full URL in the address bar or view the security report, and verify that this Web site belongs to the company you intended to visit, before entering any sensitive data.

The Red Address Bar

The use of the color red is a warning to all visitors. Either the site visited is a known phishing site that is misrepresenting its identity...

...or a problem exists with the SSL Certificate used (e.g., it has been revoked or the certificate has expired).

In both cases, make sure that you have typed the correct Web address. If the error persists, you shouldn't browse further or enter any data into this Web site.

Alternatives to the Green Bar in Firefox 3.0 and Opera 9.5

The Mozilla Firefox browser reflects security indicators to the left of the address bar. If the button to the left is white, the site does not use encrypted communication and therefore the user is not recommended to reveal any potentially sensitive data. If the button to the left of the address bar is blue, the site has recognized certification. If the user clicks on the button, the type of certificate and the name of the issuing CA appear. If the button is green, then the site has the maximum level of certification: an Extended Validation SSL certificate. If the site has any certification problem, the browser will not open it and a warning message will appear to the user.

Opera shows security information to the right of the address bar. White means that the site communication is not encrypted. Yellow indicates that the Web site has some level of certification. The color green is again used to denote that the Web site has an Extended Validation SSL certificate.

The Perception of the Green Bar

In January 2007, Tec-Ed⁵ researched usage and attitudes of 384 online shoppers and measured their responses to Web sites with and without green bars.

- 100% of participants notice whether or not a site shows the green EV bar
- 93% of participants prefer to shop on sites that show the green bar
- 97% are likely to share their credit card information on sites with the green EV bar, as opposed to only 63% with non-EV sites
- 77% of participants report that they would hesitate to shop at a site that previously showed the green EV bar and no longer does so

The Value of Extended Validation SSL

By making your Web site security more instinctively obvious, you too could see the same results that others have.

Scandinavian Design OnLine—8% increase in conversion rates⁶

"The best part of EV SSL for us is the fact that in the first two months of implementation we saw an 8% positive increase in our online conversion rates. With well over 50% of our customers seeing the green bar today, we have high hopes for the future impact that the green bar and EV SSL will have on our conversion rates."
Jörgen Bödmar, CEO, Scandinavian Design OnLine AB

Overstock.com—8.6% reduction in abandonment rates⁶

"As a result of the enhancement, site visitors with browsers which interface with the new EV SSL Certificates now abandon their shopping cart 8.6% less than visitors without an EV-enabled browser." *Geoff Atkinson, Marketing Chief of Staff, Overstock.com*

Opodo—10% increase in completed sales⁶

"We posted the VeriSign Secured Seal on the payment pages and found that completed sales rose by approximately 10% in comparison to the previous week's results. We immediately realized the impact that the trust factor can have on shopping basket abandonment rates."
Warren Jonas, Head of Service Management, Opodo⁶

About GeoTrust

GeoTrust is a leader in identity verification, credentialing and validation solutions. Its products include Web security services for secure e-commerce transactions and digital signing for documents and computer code. With more than 300,000+ companies worldwide using its technology for online security, GeoTrust has a reputation as a world class digital certificate provider.

About GeoCerts

GeoCerts SSL is an authorized GeoTrust Platinum reselling partner. Since 2003 GeoCerts has delivered deep discounts off GeoTrust's retail prices with legendary customer support.
